Warehouse **Error Analysis**

From Operational Failures to Data-Driven Optimization

Problem

- Delays in operations
- Uneven impact across errors
- Failures propagate through workflows

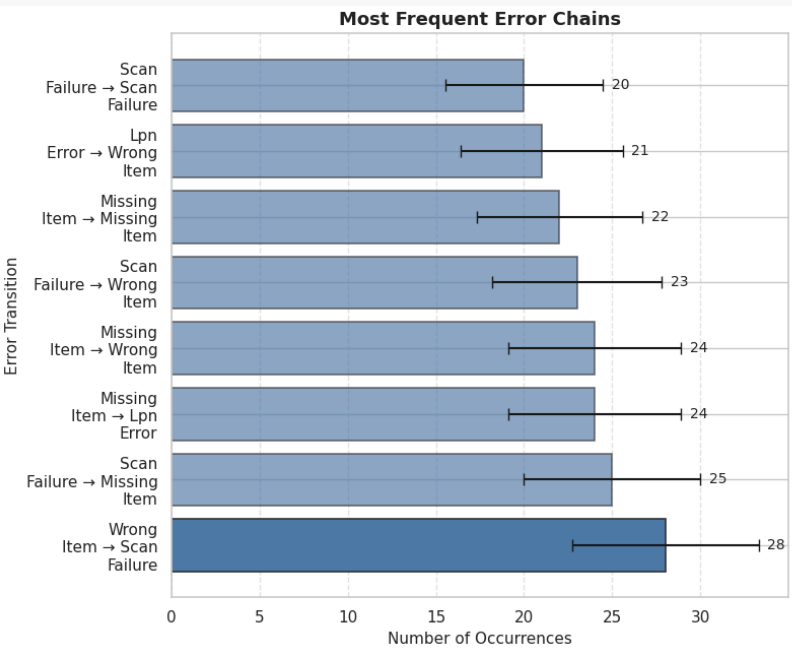
Total Time Lost

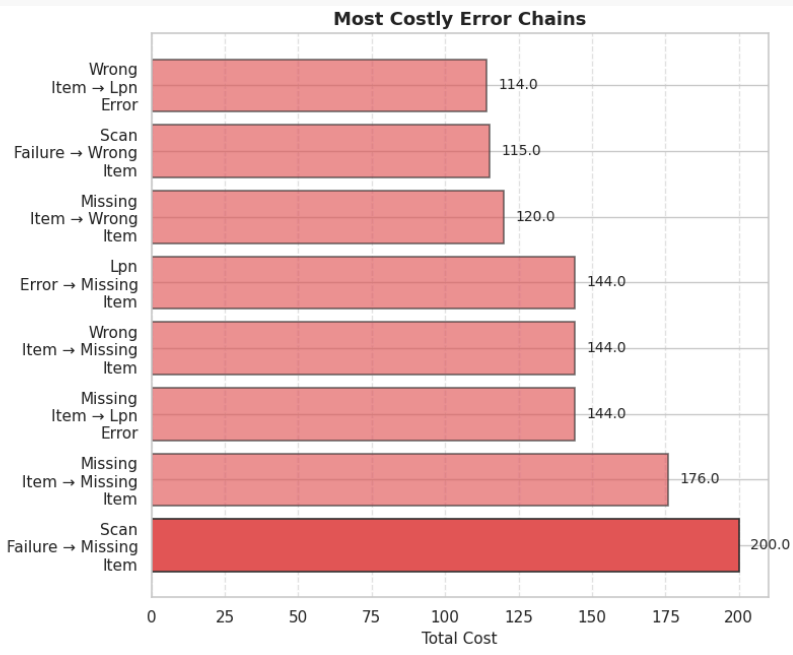
6,865 minutes

Key Findings

- **Missing Item → highest impact**
- **Picking stage → highest risk**
- **Errors propagate in chains**
- **Frequency ≠ Impact**

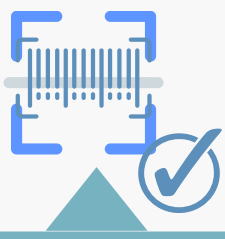
Your Frequency vs Impact





Most frequent ≠ Most costly

OPERATIONAL PRIORITIES



Improve accuracy in the picking stage

Reduce Missing Item errors first

Break error chains at their source

Errors are partially predictable (~53% accuracy)
→ Enables risk-based monitoring
